Proofpoint Email Protection helps secure and control your inbound and outbound email. It uses machine learning and multilayered detection techniques to identify and block malicious email. It also dynamically classifies today’s threats and common nuisances. And it gives you granular control over a wide range of email. This includes impostor email, phishing, malware, spam, bulk mail and more. It also offers complete flexibility with custom security policies and mail routing rules. It’s also the most deployed email security solution by the Fortune 1000. And it scales for even the largest enterprise. What’s more, it supports cloud, on-premises and hybrid installations.

Email is the No. 1 threat vector, with 96% of suspicious social actions arriving through email. In addition to common email threats like phishing attacks and malware, emerging business email compromise (BEC) has posed a new threat to organisations. Email Protection catches both known and unknown threats that others miss. By processing billions of messages each day, Proofpoint sees more threats, detects them faster and better protects you against hard-to-detect malware-less threats, such as impostor email. With Email Protection, you can stop a vast majority of threats before they arrive in your user’s inbox.

Catch Emerging Threats That Others Miss

**Detect phishing, impostor and fraudulent email**

Email Protection detects emerging threats before they can get to your user’s inbox. Proofpoint Advanced BEC Defense powered by NexusAI is designed to effectively stop a wide variety of email fraud. That includes payment redirect and supplier invoicing fraud from compromised accounts. These types of threats require a more sophisticated detection technique, as there’s often no malicious payload to detect.

1 Data Breach Investigations Report, Verizon, 2020
Advanced BEC Defense is our ML and AI-powered detection engine. It is specifically designed to find and stop BEC attacks. It dynamically detects BEC by analysing multiple message attributes. Some examples include:

- Message header data
- Sender’s IP address (x-originating IP reputation)
- Message body for urgency and words or phrases

It determines whether a message is a BEC threat. And it detects various BEC actor tactics. Such as:

- Reply-to pivots
- Use of malicious IPs
- Use of impersonated supplier domains

Advanced BEC Defense also provides granularity into BEC threat details. That includes BEC theme, gift card, payroll redirect, invoicing, lure or task. It provides observations about why the message was suspicious and message samples. That way, your security team can better understand and communicate about the attack. Data from NexusAI is then fed into the Proofpoint Nexus Threat Graph. It analyses and correlates threat information across email, cloud, network and social from all of our customers. And thus gives you the protection to stay ahead of the threat landscape.

Block malicious and unwanted email

We’ve built multilayered detection techniques into Email Protection to defend against constantly evolving threats. With signature-based detection, it blocks known threats like viruses, trojan horses and ransomware. And it uses dynamic reputation analysis to continually assess local and global IP addresses to determine whether to accept email connections. Our unique email classifier also dynamically classifies a wide variety of emails. This includes impostor, phishing, malware, spam, bulk mail, adult content and circle of trust. And it quarantines incoming email by types. Together, these features help protect you at the first signs of malicious activity.

Track Down Any Email in Seconds

Email Protection has the most powerful search capability. With the smart search feature, you can easily pinpoint hard-to-find log data based on dozens of search criteria. You can also swiftly trace where emails come from and go to. Email Protection provides you with granular details of search results, including metadata with over a hundred attributes. The search is complete in seconds, not minutes. You can download and export your search results by up to 1 million records. Moreover, several real-time reports are built into the product, giving you the detailed visibility into mail flow and trends. With this data, you can proactively address issues as they emerge.

Scales for Large Enterprise with Complete Flexibility

Email Protection supports the demands of the largest enterprises in the world. It allows you to create highly customisable email firewall rules at the global, group and user level. You can create any security policies and mail routing rules that fit your needs. And you can easily enforce them. Email Protection also provides the same benefits and greater flexibility with multiple deployment options. This includes on-premises hardware, virtual machine and SaaS.

Raise User Security Awareness

The email warning tag feature enables your users to make more informed decisions on the emails that fall into the grey area between clean and malicious. It surfaces a short description of the risk associated with a particular email. And it conveys the level of risk with different colours, which is easy to consume by your users. They can report suspicious email directly from the warning tag, even when they access email via mobile devices. This feature helps reduce the risk of potential compromise by making your users more cautious of uncertain email.

Email Protection also allows email admins to give users the ability to manage encrypted messages and low-priority emails like bulk mail, review quarantined messages and take actions directly in the Outlook task pane. User feedback is then transmitted to Proofpoint, helping us improve the global accuracy of bulk mail classification.

Centrally Manage across Email Encryption and DLP

You can easily extend your protection by adding Proofpoint Targeted Attack Protection, Email Fraud Defense, Email Encryption or Email Data Loss Prevention (DLP). While Email Protection provides you with basic email encryption and DLP capabilities, you can get more robust email encryption and DLP solutions through the same management console. This tight integration helps you manage sensitive data sent through email. It also prevents data leakage or data loss via email. And it satisfies several compliance requirements.
