

Data Security Administrator Course

The Data Security Administrator certification course equips system administrators with the expertise to effectively configure, manage, and administer core products within Proofpoint's Data Security & Posture platform. These products include Endpoint DLP, Insider Threat Management (ITM), and Cloud App Security Broker (CASB).

This course focuses on key skills such as configuration, customization, and day-to-day management, enabling administrators to defend data and detect risky behavior. This course provides hands-on experience within a classroom-lab environment to hone the data security administrator's skill set and effectively create policies to address common use cases.

Data Security Admin Course

FORMAT

Virtual Instructor-Led Training (VILT), Onsite Training At A Customer's Facility (OS)

DURATION

4
days

INTENDED AUDIENCE

Data Security Administrators

Course Syllabus

Platform Overview: In this module, you will learn how to:

- Identify the components of Proofpoint's Data Security & Posture platform
- Navigate the Data Security Workbench
- Create, edit, and manage explorations, alerts, and reports

User Management: In this module, you will learn how to:

- Configure your Identity Provider
- Add, edit, and assign permissions to user accounts
- Audit console user activities

ITM Agent Realm Configuration: In this module, you will learn how to:

- Explain the features of Endpoint DLP and ITM
- Identify the components of ITM SaaS
- Configure agent realms

ITM Agent Deployment: In this module, you will learn how to:

- Install the ITM agent on endpoints
- Install and configure the ITM agent updater on endpoints

ITM Agent Policy Configuration: In this module, you will learn how to:

- Identify which features are controlled through agent policies
- Configure effective agent policies
- Assign agent policies to your agent realms

Data Classification Application: In this module, you will learn how to:

- Identify the purpose and tools of the Data Classification Application
- Create effective and efficient data detectors and detector sets
- Create and apply data snippet masking policies

Endpoint Content Scanning: In this module, you will learn how to:

- Identify types of content that can be scanned for sensitive data
- Enable content scanning on an agent realm

ITM and Endpoint Rules and Conditions: In this module, you will learn how to:

- Identify when to use detection, prevention, and endpoint rules
- Create, edit, and apply rules and rule sets
- Evaluate and fine-tune rules to better fit specific use cases

Notification Policies: In this module, you will learn how to:

- Identify types of end-user notifications available through Data Security & Posture
- Create and apply notification policies
- Create exploration subscriptions

Data Security Workbench Customizations: In this module, you will learn how to:

- Customize options for workflow status and tags
- Display, edit, delete, share, and tag an exploration
- Navigate and customize the elements in the Data Security Workbench's My Dashboard and the Cloud Apps Dashboard

CASB Setup: In this module, you will learn how to:

- Configure cloud providers
- Explain access rules, data rules, app governance rules, and configuration and security posture rules
- Configure policies to match specific use cases

Tuning CASB Performance: In this module, you will learn how to:

- Address potential notification and remediation delays with rules

Staying Current: In this module, you will learn how to:

- Identify resources that can be used to stay current on product and service updates
- Access in-product documentation, Knowledge Base (KB) articles, and customer support
