

Threat Protection Administrator Course

The Proofpoint Threat Protection Administrator certification course builds advanced administrative expertise in utilizing Proofpoint's comprehensive suite, focusing on the day-to-day operations and tasks carried out by those administering Proofpoint platforms. This course dives into many of the Proofpoint products used to safeguard your organization from sophisticated email threats.

Facilitated by our experienced instructors and with practical engaging labs this advanced hands-on course will equip you to administer and manage products like the Email Protection Server, Targeted Attack Protection, Cloud Threat Response and Closed-Loop Email Analysis & Response.

Threat Protection Admin Course

FORMAT

Virtual Instructor-Led Training (VILT), Onsite Training At A Customer's Facility (OS)

DURATION

4
days

INTENDED AUDIENCE

Messaging and Security Administrators

Course Syllabus

Proofpoint products overview: In this lesson, you will learn to:

- Identify the different Proofpoint Threat Protection tools and products
- Understand the fundamental principles governing how each individual tool functions
- Describe the ways in which these tools are designed to integrate and interact with one another to achieve cohesive system operation

Mail Flow: In this lesson, you will learn:

- How the Protection Server manages Inbound and Outbound mail routes
- Mail Relays configuration
- How the protection server utilizes the SMTP Protocol through the SMTP session calls
- Configuring DNS and Domain Setup
- How Policy Routes work in the Protection Server
- Enabling and enforcing TLS to specific domains
- Generate Certificates

- How the Protection Server processes Inbound and Outbound messages
- Policies & Rules in the Protection Server
- How the Protection Server filters mail
- How to create SMTP Profiles

- Add or modify rules based to specified mail conditions and enforcing dispositions
- Manage SMTP Rate Control with configuration settings and rules
- Configure Outbound Throttle and send mail thresholds
- Enable Bounce Management and reduce backscatter mail
- Create and modify Dictionaries to mitigate offensive content
- Configure Recipient Verification rules and profiles

- Create and delete quarantine folders
- Configure quarantine folder settings for specific messages and triggered rules
- Search for and release quarantined messages
- Manage Quarantine precedence order

- How to use Smart Search to find and investigate messages
- The purpose of different logs, entry formats and investigate mail flow
- How to use the search and filtering data within Audit Logs
- How to review and export Syslogs
- How to explore and understand PoD API

- Creating alert profiles to receive system alerts
- Configuring alert rules to give greater control and flexibility over what alerts you want to receive
- Viewing and analyzing system alerts
- Viewing system reports to see how your system is performing

- Explore the email security posture on how Email Authentication is implemented by the Protection Server
- Configure SPF policies and rules
- Configure DKIM policies, rules and signing
- Configure DMARC policies and rules
- Create Email Authentication keys

- Sync your Active Directory to the Proofpoint Protection Server
- Add or import User Profiles
- Create Groups and Sub-Groups
- Configure LDAP/Azure/SSO
- Configure roles and access to Cloud & On-Prem UI's

- Create Policies
- Create and tune rules to determine how you want Spam to be managed
- Create Safe and Block Lists
- Create Custom Spam rules specific to your organization's threats

- The purpose and operation of the Virus Protection Module
- Restrict to, or disable processing on, certain policy routes
- Creating Virus Protection Policies
- Creating and editing Virus Protection Rules

- The purpose of Email Warning Tags
- Tag precedence
- Restricting message tagging to specific routes
- Customizing Email Warning Tags
- Configuring Email Digest

- URL Rewrite and its settings
- The purpose of Message Defence and configure settings
- TAP Dashboard and implement custom blocklists, add users and privileges
- The purpose of each TAP Dashboard API and create API keys and extract data

- Differentiate between Cloud vs On-Prem Threat defense
- Explore Initial deployment tasks
- Configure and connect mail servers
- Enable automation workflows
- Create customizable lists for message attributes
- Import Sources
- Understand how Closed Loop Email Analysis & Response plays in to Threat Response

Threat Protection Administrator Exam

proofpoint.
certified guardian

The Proofpoint Threat Protection Administrator certification exam validates your ability to effectively administer and manage Proofpoint's security solutions in real world environments. Focused on day-to-day operational skills, the exam assesses your expertise across key products including Email Protection Server, Targeted Attack Protection, Threat Response, and Closed-Loop Email Analysis & Response. Candidates will demonstrate practical knowledge in threat protection and platform management, ensuring they are fully prepared to protect their organizations against advanced email-based threats. Successfully passing this exam certifies your advanced administrative proficiency and operational readiness within the Proofpoint Email Protection Suite.

minutes

INTENDED AUDIENCE

This exam is ideal for IT professionals and security administrators or security analysts looking to expand their skillset. This exam will vastly expand your cybersecurity expertise and fully leverage Proofpoint products in the fight against cyber threats on an Administration level.

RECOMMENDED LEARNING

Proofpoint Threat Protection
Administrator Course

Exam Core Components

- **Product Overview:** Understand key product functionalities and their integration within the suite
- **Mail Flow:** Learn how the Email Protection Server manages inbound/outbound mail, routes, SMTP, TLS, and certificates
- **Message Processing:** Build policies and rules for message filtering and disposition, and configure SMTP profiles
- **Email Firewall:** Create and manage mail rules, control SMTP rate, configure outbound throttling, and enhance email security
- **Quarantine:** Manage quarantine folders, configure settings, release messages, and understand precedence
- **Smart Search & Logging:** Use Smart Search, analyze logs, configure syslogs and leverage PoD API for insights
- **Alerts & Reporting:** Configure alert profiles, manage notifications, and monitor system performance with reports
- **Email Authentication:** Configure SPF, DKIM, and DMARC policies, and set up email authentication keys
- **User Management:** Sync AD, import profiles, configure LDAP/SSO, and set user roles and access
- **Spam Detection:** Tune spam management policies, create custom spam rules, and configure safe/block lists
- **Virus Protection:** Configure virus protection policies, restrict processing, and edit rules

- **User Notifications:** Set up and customize email warning tags, tag routes, and configure email digests
- **Targeted Attack Protection (TAP):** Manage URL Rewrite, configure Message Defense, and use the TAP Dashboard
- **Threat Response:** Differentiate Cloud vs. On-Prem defense, configure servers, workflows, and manage threat response

Exam Benefits

Gain comprehensive expertise in Proofpoint's advanced security solutions. Successfully passing this exam certifies your ability to manage and defend against complex cyber threats using Proofpoint's suite of tools. Master core areas such as email protection, user management, advanced security configurations and threat response. Equip yourself with the skills and confidence to tackle any cybersecurity challenge and join a community of professionals committed to safeguarding organizations from evolving threats.
