Is Microsoft Office 365 Secure?

The world is moving to Office 365. Don’t leave security, compliance, and control up in the air. Many organizations already use or are planning to migrate to Microsoft Office 365. Working with UBM Research, we surveyed security professionals to discover the top security, encryption, and archiving challenges when moving to the cloud.

Key takeaway: Advanced threats strike at your users. Third party solutions can help extend Office 365 security to block threats, gain insight into the attack, and automate response.

Cloud Adoption is on the Rise

But the Move Brings New Risks

Over Three-Quarters Use Cloud-Based Apps

As more and more global enterprises make the move, confidence in the cloud is growing. And with the right security measures in place, the cloud can become a safe investment.

Office 365 Sees Big Growth

More than four in ten organizations are in the process of implementing Office 365 or already use it.

Security Gaps

System Performance

Compliance

Did you know?

91% of security pros say vulnerabilities introduced through off-the-shelf applications or systems consume the biggest chunk of their workday.

Users are feeling insecure about Office 365 and known threats.

91% are not very confident in Microsoft Office 365 to detect and block known threats.

98% are concerned about Microsoft Office 365’s inability to detect and block zero-day and advanced threats.

91% of targeted attacks start with email.

Sophisticated social engineering makes email the most reliable way to reach nearly every person in every organization around the world.

And they’re feeling even less secure about unknown threats.

67% are most concerned about sophisticated attacks targeted directly at the organization...

52% are concerned about Microsoft Office 365’s inability to detect and block zero-day and advanced threats.

Visibility is Paramount When Users Become a Target

Only one in three have confidence in Office 365’s ability to provide intelligence for incident response.

Enhance Office 365 with Stronger Security

Layer advanced security on:

1. Detect and block attacks against your users more effectively.

2. Increase visibility with forensic insights in an attack.

3. Automate response to quickly remove threats before they can cause lasting harm.
